SOLUTIONS PROBLEM SHEET IV

16.16. Relate the matrix elements of the decay $\Delta^{++}, \Delta^+, \Delta^0$ and Δ^- to pions and nucleons assuming isospin invariance. ($I(\Delta) = 3/2$).

Solutions:

$\Delta^{++}(I = 3/2; I_z = 3/2)$ can decay to $p + \pi^+$ and let the decay rate be given by Γ . I, I_z of Δ^+, Δ^0 and Δ^- are $1/2, -1/2$ and $-3/2$ respectively. The final state of the nucleon and the pion is also $I = 3/2$ we have

$$|p\pi^+ \rangle = |I = 3/2, I_z = 3/2 \rangle;$$

$$|p\pi^0 \rangle = \left(\frac{2}{3}\right)^{1/2} |I = 3/2, I_z = 1/2 \rangle + \left(\frac{1}{3}\right)^{1/2} |I = 1/2, I_z = 1/2 \rangle$$

$$|p\pi^- \rangle = \left(\frac{1}{3}\right)^{1/2} |I = 3/2, I_z = -1/2 \rangle - \left(\frac{2}{3}\right)^{1/2} |I = 1/2, I_z = -1/2 \rangle$$

$$|n\pi^+ \rangle = \left(\frac{1}{3}\right)^{1/2} |I = 3/2, I_z = 1/2 \rangle + \left(\frac{2}{3}\right)^{1/2} |I = 1/2, I_z = 1/2 \rangle$$

$$|n\pi^0 \rangle = \left(\frac{2}{3}\right)^{1/2} |I = 3/2, I_z = -1/2 \rangle + \left(\frac{1}{3}\right)^{1/2} |I = 1/2, I_z = -1/2 \rangle$$

$$|n\pi^- \rangle = |I = 3/2, I_z = -3/2 \rangle$$

Since the final state is only $I = 3/2$, we get for the matrix elements the following

$$\langle p\pi^+ | M | \Delta^{++} \rangle = \langle I = 3/2, I_z = 3/2 | M | \Delta^{++} \rangle$$

$$\langle p\pi^0 | M | \Delta^+ \rangle = \left(\frac{2}{3}\right)^{1/2} \langle I = 3/2, I_z = 1/2 | M | \Delta^+ \rangle$$

$$\langle n\pi^+ | M | \Delta^+ \rangle = \left(\frac{1}{3}\right)^{1/2} \langle I = 3/2, I_z = 1/2 | M | \Delta^+ \rangle$$

$$\langle p\pi^- | M | \Delta^0 \rangle = \left(\frac{1}{3}\right)^{1/2} \langle I = 3/2, I_z = -1/2 | M | \Delta^0 \rangle$$

$$\langle n\pi^0 | M | \Delta^0 \rangle = \left(\frac{2}{3}\right)^{1/2} \langle I = 3/2, I_z = -1/2 | M | \Delta^0 \rangle$$

$$\langle n\pi^- | M | \Delta^- \rangle = \langle I = 3/2, I_z = -3/2 | M | \Delta^- \rangle$$

Thus the decay rates are

$$\Gamma(\Delta^{++} \rightarrow p\pi^+) = \Gamma$$

(by definition)

$$\Gamma(\Delta^+ \rightarrow p\pi^0) = \frac{2}{3}\Gamma$$

$$\Gamma(\Delta^+ \rightarrow n\pi^+) = \frac{1}{3}\Gamma$$

$$\Gamma(\Delta^0 \rightarrow p\pi^-) = \frac{1}{3}\Gamma$$

$$\Gamma(\Delta^0 \rightarrow n\pi^0) = \frac{2}{3}\Gamma$$

$$\Gamma(\Delta^- \rightarrow n\pi^-) = \Gamma$$

17. Generalised statistics states that isospin wave function \times spin wave function \times spatial wave function should be symmetric (antisymmetric) for bosons (fermions) under the interchange of particles. Find the combinations allowed (isospin, spin and spatial) for (a) two pions (b) two nucleons. The spatial wave function can be considered as the orbital angular momentum

Solutions:

Two pions: Three possible isospin states $I = 0, 1, 2$ out of which $I = 1$ is antisymmetric and $I = 0, 2$ are symmetric. Since pions are spinless we have for $I = 1$ odd orbital angular momentum states and for $I = 0, 2$ even orbital angular momentum.

Two Nucleons: $I = 0, 1; S = 0, 1$ $I = 0$ and $S = 0$ are antisymmetric in isospin and spin respectively and $I = 1$ and $S = 1$ are symmetric in isospin and spin respectively. The total wave function is odd under the interchange of the two particle. Thus the allowed angular momenta L are as follows:

$L = \text{even}$ for $I = 1, S = 0$ or $I = 0, S = 1$ and $L = \text{odd}$ for $I = 1, S = 1$ and $I = 0, S = 0$.

18. Isospin (J^P) of ω^0 is $I=1$ and 1^- . (It's mass is $780 \text{ MeV}/c^2$) Show that it can not decay into two pions if isospin is conserved. Given that deuteron is in $l = 0, S = 1$ find the isospin of deuteron.

Solution:

$I = 0$ for two pions means isospin is symmetric. Statistics implies that, since pions are spinless $L = J$ is even. Since $J(\omega^0) = 1$ the decay can not occur if isospin is conserved in the decay.

19. η^0 is an $I=0$ and $J^P = 0^-$ particle .(It's mass $=550\text{Mev}/c^2$) Show that it can not decay to two pions if parity is conserved in the decay.

Solution:

The intrinsic parity of pion is negative. Therefore the final state parity of the two pions is $(-1)^L$. Since the initial angular momentum is 0 the final angular momentum (= the orbital angular momentum of the two spinless pions) $L = 0$ and thus the parity of the final two pion state would be positive. Since η is a state of -ve parity the decay is forbidden if parity is conserved.

20. ω^0 decays to three pions, $\omega^0 \rightarrow \pi^0 + \pi^+ + \pi^-$. Let the average energies of π^+, π^- be $\langle E_+ \rangle, \langle E_- \rangle$ respectively. (a) Write down an expression for the average values $\langle E_+ \rangle$ and $\langle E_- \rangle$ in terms of $|M|^2$ and phase space integral over the three momenta of pions. ($|M|^2$ is the square of the appropriate matrix element.) (b) Show that if C or CP is a conserved in the decay $\langle E_+ \rangle = \langle E_- \rangle$.

Solution:

The expression for the average values can be obtained by noting that the probability $P(\pi^+(E_+), \pi^-(E_-), \pi^0(E_0))$ of producing a given state with energy E_{\pm} is given by

$$P(\pi^+(E_+), \pi^-(E_-), \pi^0(E_0)) = \int \frac{d^3p_+ d^3p_- d^3p_0}{16E_+ E_- E_0 M_\omega} \delta^4(P_\omega - P_+ - P_- - P_0) \\ \delta(P_+^0 - E_+) \delta(P_-^0 - E_-) \delta(P_0^0 - E_0) | \langle \pi^+(P_+), \pi^-(P_-), \pi^0(P_0) | M | \omega^0 \rangle |^2$$

(a) Thus

$$\langle E_{\pm} \rangle = \frac{\int dE_+ dE_- dE_0 P(\pi^+(E_+), \pi^-(E_-), \pi^0(E_0)) E_{\pm}}{\int dE_+ dE_- dE_0 P(\pi^+(E_+), \pi^-(E_-), \pi^0(E_0))}$$

(b) Note

$$| \langle \pi^+(P_+), \pi^-(P_-), \pi^0(P_0) | M | \omega^0 \rangle |^2 = | \langle \pi^-(P_+), \pi^+(P_-), \pi^0(P_0) | M | \omega^0 \rangle |^2$$

from C-invariance. Thus

$$\begin{aligned}
\langle E_+ \rangle &= \frac{\int dE_+ dE_- dE_0 P(\pi^+(E_+), \pi^-(E_-), \pi^0(E_0)) E_+}{\int dE_+ dE_- dE_0 P(\pi^+(E_+), \pi^-(E_-), \pi^0(E_0))} \\
&= \frac{\int dE_+ dE_- dE_0 P(\pi^-(E_+) \pi^+(E_-) \pi^0(E_0)) E_+}{\int dE_+ dE_- dE_0 P(\pi^+(E_-) \pi^-(E_+) \pi^0(E_0))}
\end{aligned}$$

Interchanging the integration variables E_+ and E_- in the numerator we get

$$\begin{aligned}
\langle E_+ \rangle &= \frac{\int dE_+ dE_- dE_0 P(\pi^-(E_-) \pi^+(E_+) \pi^0(E_0)) E_-}{\int dE_+ dE_- dE_0 P(\pi^+(E_-) \pi^-(E_+) \pi^0(E_0))} \\
&= \langle E_- \rangle
\end{aligned}$$

which proved the desired result.
